

Proposed Solution

Project: ComicCraft | AI/ML & Generative AI

1. Proposed Solution

ComicCraft is a browser-based Generative AI application where users enter a creative idea and receive a structured comic story. The solution automates the initial story-planning stage and gives the user a four-panel draft.

2. Solution Workflow

- User opens ComicCraft.
- User enters a creative prompt.
- Frontend sends the prompt to FastAPI.
- FastAPI sends the prompt to Gemini AI.
- Gemini generates the comic story.
- The result is returned and displayed as four panels.

3. Core Features

- Prompt-based comic story generation
- Four-panel story organization
- Simple web interface
- FastAPI backend
- Gemini AI integration
- Foundation for visual comic creation

4. Expected Benefit

The proposed solution reduces the manual effort required to turn an initial idea into a structured comic draft, while keeping the user in control of the creative prompt.

5. Future Extension

Image generation, character consistency, speech bubbles and comic export can be added to transform the text draft into a more complete visual comic.
