

Solution Architecture

Project: ComicCraft | AI/ML & Generative AI

1. Architecture Overview

The ComicCraft architecture separates the user interface, backend API, Generative AI service and output presentation so that each part can be maintained and extended independently.

2. Architecture Components

- User/Browser - enters prompts and views results.
- Frontend - collects user input and communicates with the backend.
- FastAPI Backend - validates requests, orchestrates AI generation and returns responses.
- Gemini AI - generates the requested comic story content.
- Response Processing - organizes the generated content for the UI.
- Four-Panel Comic Output - presents the generated comic draft to the user.

3. Design Principles

- Modular separation of concerns
- Simple API-driven workflow
- Secure configuration
- Extensibility for future image generation and exports
