

PROJECT DEMONSTRATION

Project Demo Planning

Prepared for:

ComicCraft - AI Comic Story Creator using Gemini Models

An AI-powered application that transforms a user's idea into a structured comic story with characters, scenes, dialogue, and visual comic panels.

Project Demonstration Plan

This document provides the planned flow, features, technical demonstration, expected output, and evaluation points for the ComicCraft project.

1. Demonstration Overview

Project Name: ComicCraft - AI Comic Story Creator using Gemini Models

Purpose: Demonstrate how generative AI can convert a simple user idea into an engaging comic story and organize it into comic-ready scenes.

Target Users: Students, writers, teachers, content creators, and users who want to create short comic stories without advanced writing or illustration skills.

Key Demonstration Goals

1	Accept a story idea or prompt from the user.
2	Generate a coherent comic story using Gemini models.
3	Create characters, scenes, and dialogue in a structured format.
4	Generate or prepare visual prompts for comic panels.
5	Display the final comic story in an easy-to-understand interface.

2. Demonstration Flow

Step	Demonstration Action	Expected Result
1	Open ComicCraft application	Home screen / story creation interface
2	Enter story idea, genre and style	User prompt captured
3	Submit prompt to Gemini-powered generation	AI processes the request
4	Generate story structure	Title, characters, plot and scenes
5	Generate scene dialogue	Character-wise dialogue for each scene
6	Prepare comic panel prompts	Panel descriptions / visual prompts
7	Display final comic	Readable comic-style output
8	Regenerate or edit	User can refine the story

3. Technical Demonstration

The demonstration should clearly show the connection between the user interface, Gemini models, structured story generation, and the final comic presentation.

Core Components

Component	Role in ComicCraft
User Interface	Collects story idea, genre, characters, tone and other preferences.
Gemini Model	Generates story content, character details, scenes and dialogue from the prompt.
Prompt Engineering	Uses structured prompts to improve consistency and comic-friendly output.
Story Parser / Formatter	Converts the generated response into title, characters, scenes and panels.
Comic Panel Generator / Visual Prompt Creator	Creates panel descriptions or prompts for comic visuals.
Output Viewer	Presents the completed comic in a clear, readable sequence.

4. Sample Live Demo Scenario

User Input Example: “Create a short superhero comic about a student who discovers a hidden power and uses it to protect the city.”

Selected Options: Genre – Superhero; Tone – Exciting; Length – Short; Audience – General.

AI Output to Demonstrate:

Output 1	Comic title
Output 2	Main character and supporting characters
Output 3	Beginning, conflict, climax and ending
Output 4	Scene-by-scene descriptions
Output 5	Character dialogue and narration
Output 6	Comic panel / visual prompts

5. Expected Demonstration Result

At the end of the demonstration, the audience should be able to see a complete transformation from a simple idea into an organized comic story. The result should be understandable even to a first-time user.

Evaluation Points

Criteria	What to Demonstrate
Ease of Use	User can enter an idea with minimal steps.
Story Quality	Generated story has a clear beginning, conflict and ending.
Character Consistency	Characters remain identifiable across scenes.
Dialogue Quality	Dialogue is relevant to the scene and character.
Visual Readiness	Each scene can be converted into a comic panel.
Editability	User can regenerate or modify the generated story.
Response Time	Generation process and user feedback are clearly shown.

6. Demo Checklist

- Application starts successfully.
- User input form is ready.
- Gemini API/model connection is working.
- Sample prompt is prepared for the live demo.
- Story generation output is visible.
- Characters and scenes are structured correctly.
- Comic panel prompts or visuals are displayed.
- Edit / regenerate option is demonstrated.
- Final comic output is shown.
- Demo ends with key project benefits and future scope.

7. Conclusion

ComicCraft demonstrates the practical use of Gemini models for creative content generation. The project combines natural-language input, AI story generation, structured scene creation, dialogue generation and comic-oriented presentation into a single workflow.
