

Coding & Solution

Project: ComicCraft | AI/ML & Generative AI

1. Coding Overview

ComicCraft uses Python and FastAPI for the backend, HTML/CSS/JavaScript for the frontend, and Gemini AI for Generative AI content creation.

2. Implementation Flow

- Create and run the FastAPI application.
- Serve the ComicCraft web interface.
- Accept a comic/story prompt from the user.
- Send the prompt to Gemini AI with generation instructions.
- Process the generated response.
- Return the result to the frontend.
- Display the result as a four-panel comic draft.

3. Input and Output

Input: User's creative comic prompt.

Processing: FastAPI + Gemini AI.

Output: Generated story and four-panel comic structure.

4. Error Handling

- Validate incoming prompt data.
- Handle invalid or missing API configuration.
- Handle AI or network errors.
- Return clear feedback to the user.

5. Solution Outcome

The implemented solution provides the core text-based comic generation workflow and a base for future visual comic generation.
