

Problem-Solution Fit

Project: ComicCraft | AI/ML & Generative AI

Problem to Solution Mapping

ComicCraft is designed to address the initial creative and story-structuring challenges faced by comic creators.

User Problem	ComicCraft Response
User has an idea but cannot easily structure it as a comic.	Generative AI converts the idea into a structured story.
Manual panel planning takes time.	Four-panel output provides an initial scene sequence.
Dialogue and scene writing can be difficult.	AI can draft story, scene and dialogue content.
Users may lack illustration skills.	Future versions can generate visual panel images.
Using many separate tools is inconvenient.	ComicCraft combines prompt input and AI generation in one web application.

Fit Summary

The core fit is between a simple creative input and an automated AI-assisted story-creation workflow. Visual generation is planned as an extension of this initial fit.
